Functions of  
Several Random  
Variables

Approximating the  
Mean and Variance  
of a Function

Expectations and  
variances of linear  
combinations

The Central Limit  
Theorem

- ▶ We often consider functions of random variables of the form:

$$U = g(X, Y, \dots, Z)$$

where  $X, Y, \dots, Z$  are random variables.

- ▶  $U$  is itself a random variable.

## Example: connecting steel parts

- Suppose that a steel plate with nominal thickness .15 in. is to rest in a groove of nominal width .155 in., machined on the surface of a steel block.

Relative Frequency Distribution of Plate Thicknesses

Plate Thickness (in.)	Relative Frequency
.148	.4
.149	.3
.150	.3

Relative Frequency Distribution of Slot Widths

Slot Width (in.)	Relative Frequency
.153	.2
.154	.2
.155	.4
.156	.2

- $X$  = plate thickness
- $Y$  = slot width
- $U = Y - X$ , the “wiggle room” of the plate

# The distributions of $X$ , $Y$ , and $U$

Marginal and Joint Probabilities for  $X$  and  $Y$

$y \backslash x$	.148	.149	.150	$f_Y(y)$
.156	.08	.06	.06	.2
.155	.16	.12	.12	.4
.154	.08	.06	.06	.2
.153	.08	.06	.06	.2
$f_X(x)$	.4	.3	.3	

The Probability Function for the  
Clearance  $U = Y - X$

$u$	$f(u)$
.003	.06
.004	.12 = .06 + .06
.005	.26 = .08 + .06 + .12
.006	.26 = .08 + .12 + .06
.007	.22 = .16 + .06
.008	.08

- Determining the distribution of  $U$  is difficult in the continuous case.

Dason Kurkiewicz

Functions of  
Several Random  
Variables

Approximating the  
Mean and Variance  
of a Function

Expectations and  
variances of linear  
combinations

The Central Limit  
Theorem

- ▶ If  $X, Y, \dots, Z$  are independent,  $g$  is well-behaved, and the variances  $Var(X), Var(Y), \dots, Var(Z)$  are small enough, then  $U = g(X, Y, \dots, Z)$  has:

$$E(U) \approx g(E(X), E(Y), \dots, E(Z))$$

$$Var(U) \approx \left(\frac{\partial g}{\partial x}\right)^2 Var(X) + \left(\frac{\partial g}{\partial y}\right)^2 Var(Y) + \dots + \left(\frac{\partial g}{\partial z}\right)^2 Var(Z)$$

- ▶ These formulas are often called the **propagation of error formulas**.

## Example: an electric circuit

- ▶  $R$  is the total resistance of the circuit.
- ▶  $R_1$ ,  $R_2$ , and  $R_3$  are the resistances of resistors 1, 2, and 3, respectively.
- ▶  $E(R_i) = 100$ ,  $\text{Var}(R_i) = 2$ ,  $i = 1, 2, 3$ .

$$R = g(R_1, R_2, R_3) = R_1 + \frac{R_2 R_3}{R_2 + R_3}$$

## Example: an electric circuit

Variables (Ch. 5.5)

Dason Kurkiewicz

Functions of  
Several Random  
Variables

Approximating the  
Mean and Variance  
of a Function

Expectations and  
variances of linear  
combinations

The Central Limit  
Theorem

$$E(R) \approx g(100, 100, 100) = 100 + \frac{(100)(100)}{100 + 100} = 150\Omega$$

$$\frac{\partial g}{\partial r_1} = 1$$

$$\frac{\partial g}{\partial r_2} = \frac{(r_2 + r_3)r_3 - r_2r_3}{(r_2 + r_3)^2} = \frac{r_3^2}{(r_2 + r_3)^2}$$

$$\frac{\partial g}{\partial r_3} = \frac{(r_2 + r_3)r_2 - r_2r_3}{(r_2 + r_3)^2} = \frac{r_2^2}{(r_2 + r_3)^2}$$

$$\begin{aligned}\text{Var}(R) &\approx (1)^2(2)^2 + \left(\frac{(100)^2}{(100 + 100)^2}\right)^2 (2)^2 + \left(\frac{(100)^2}{(100 + 100)^2}\right)^2 (2)^2 \\ &= 4.5\end{aligned}$$

$$\text{SD}(R)\sqrt{4.5} \approx 2.12\Omega$$

combinations

The Central Limit  
Theorem

- ▶  $X_1, X_2, \dots, X_n$  are independent random variables and

$$Y = a_0 + a_1X_1 + a_2X_2 + \cdots + a_nX_n$$

then:

$$\begin{aligned} E(Y) &= E(a_0 + a_1X_1 + a_2X_2 + \cdots + a_nX_n) \\ &= a_0 + a_1E(X_1) + a_2E(X_2) + \cdots + a_nE(X_n) \end{aligned}$$

$$\begin{aligned} \text{Var}(Y) &= \text{Var}(a_0 + a_1X_1 + a_2X_2 + \cdots + a_nX_n) \\ &= a_1^2 \cdot \text{Var}(X_1) + a_2^2 \cdot \text{Var}(X_2) + \cdots + a_n^2 \cdot \text{Var}(X_n) \end{aligned}$$

# Your turn: linear combinations

- Say we have two independent random variables  $X$  and  $Y$  with  $E(X) = 3.3$ ,  $Var(X) = 1.91$ ,  $E(Y) = 25$ , and  $Var(Y) = 65$ .
- Find:

$$E(3 + 2X - 3Y)$$

$$E(-4X + 3Y)$$

$$E(-4X - 6Y)$$

$$Var(3 + 2X - 3Y)$$

$$Var(2X - 5Y)$$

$$Var(-4X - 6Y)$$

## Answers: linear combinations

variances of linear  
combinations

The Central Limit  
Theorem

$$\begin{aligned}E(3 + 2X - 3Y) &= 3 + 2E(X) - 3E(Y) \\&= 3 + 2 \cdot 3.3 - 3 \cdot 25 \\&= -65.4\end{aligned}$$

$$\begin{aligned}E(-4X + 3Y) &= -4E(X) + 3E(Y) \\&= -4 \cdot 3.3 + 3 \cdot 25 \\&= 61.8\end{aligned}$$

$$\begin{aligned}E(-4X - 6Y) &= -4 \cdot E(X) - 6 \cdot E(Y) \\&= -4 \cdot 3.3 - 6 \cdot 25 \\&= -163.2\end{aligned}$$

## Answers: linear combinations

Functions of  
Several Random  
Variables (Ch. 5.5)

Dason Kurkiewicz

Functions of  
Several Random  
Variables

Approximating the  
Mean and Variance  
of a Function

Expectations and  
variances of linear  
combinations

The Central Limit  
Theorem

$$\begin{aligned}\text{Var}(3 + 2X - 3Y) &= 2^2 \cdot \text{Var}(X) + (-3)^2 \text{Var}(Y) \\ &= 4 \cdot 1.91 + 9 \cdot 65 \\ &= 592.64\end{aligned}$$

$$\begin{aligned}\text{Var}(2X - 5Y) &= 2^2 \cdot \text{Var}(X) + (-5)^2 \text{Var}(Y) \\ &= 4 \cdot 1.91 + 25 \cdot 65 \\ &= 1632.64\end{aligned}$$

$$\begin{aligned}\text{Var}(-4X - 6Y) &= (-4)^2 \cdot \text{Var}(X) + (-6)^2 \text{Var}(Y) \\ &= 16 \cdot 1.91 + 36 \cdot 65 \\ &= 2370.56\end{aligned}$$

# Your turn: more linear combinations

Functions of  
Several Random  
Variables (Ch. 5.5)

Dason Kurkiewicz

Functions of  
Several Random  
Variables

Approximating the  
Mean and Variance  
of a Function

Expectations and  
variances of linear  
combinations

The Central Limit  
Theorem

- ▶ Say  $X \sim \text{Binomial}(n = 10, p = 0.5)$  and  $Y \sim \text{Poisson}(\lambda = 3)$ .
- ▶ Calculate:

$$E(5 + 2X - 7Y)$$

$$\text{Var}(5 + 2X - 7Y)$$

## Answer: more linear combinations

- First, note that:

$$E(X) = np = 10 \cdot 0.5 = 5$$

$$E(Y) = \lambda = 3$$

$$\text{Var}(X) = np(1 - p) = 10(0.5)(1 - 0.5) = 2.5$$

$$\text{Var}(Y) = \lambda = 3$$

Now, we can calculate:

$$\begin{aligned} E(5 + 2X - 7Y) &= 5 + 2E(X) - 7E(Y) \\ &= 5 + 2 \cdot 5 - 7 \cdot 3 \\ &= -6 \end{aligned}$$

$$\begin{aligned} \text{Var}(5 + 2X - 7Y) &= 2^2 \cdot \text{Var}(X) + (-7)^2 \cdot \text{Var}(Y) \\ &= 4 \cdot 2.5 + 49 \cdot 3 \\ &= 157 \end{aligned}$$

# iid random variables.

- ▶ **Identically Distributed:** Random variables  $X_1, X_2, \dots, X_n$  are identically distributed if they have the same probability distribution.
- ▶ **“iid”:** Random variables  $X_1, X_2, \dots, X_n$  are iid if they are **I**ndependent and **I**dentically **D**istributed.

# Your turn: averages of iid random variables

- ▶  $X_1, X_2, \dots, X_n$  are iid with expectation  $\mu$  and variance  $\sigma^2$ .
- ▶ Derive:

$$E(\bar{X})$$

$$\text{Var}(\bar{X})$$

where:

$$\bar{X} = \frac{X_1 + X_2 + \dots + X_n}{n}$$

the mean of the  $X_i$ 's.

# Answers: averages of iid random variables

Functions of  
Several Random  
Variables (Ch. 5.5)

Dason Kurkiewicz

Functions of  
Several Random  
Variables

Approximating the  
Mean and Variance  
of a Function

Expectations and  
variances of linear  
combinations

The Central Limit  
Theorem

$$\begin{aligned} E(\bar{X}) &= E\left(\frac{X_1 + X_2 + \cdots + X_n}{n}\right) \\ &= \frac{1}{n}E(X_1) + \frac{1}{n}E(X_2) + \cdots + \frac{1}{n}E(X_n) \\ &= \underbrace{\frac{1}{n}\mu + \frac{1}{n}\mu + \cdots + \frac{1}{n}\mu}_{n \text{ times}} \\ &= n \cdot \frac{1}{n}\mu \\ &= \boxed{\mu} \end{aligned}$$

► Remember  $E(\bar{X}) = \mu$ : it's an important result.

# Answers: averages of iid random variables

Functions of  
Several Random  
Variables (Ch. 5.5)

Dason Kurkiewicz

Functions of  
Several Random  
Variables

Approximating the  
Mean and Variance  
of a Function

Expectations and  
variances of linear  
combinations

The Central Limit  
Theorem

$$\begin{aligned} \text{Var}(\bar{X}) &= \text{Var}\left(\frac{X_1 + X_2 + \cdots + X_n}{n}\right) \\ &= \left(\frac{1}{n}\right)^2 \text{Var}(X_1) + \left(\frac{1}{n}\right)^2 \text{Var}(X_2) + \cdots + \left(\frac{1}{n}\right)^2 \cdot \text{Var}(X_n) \\ &= \underbrace{\frac{1}{n^2}\sigma^2 + \frac{1}{n^2}\sigma^2 + \cdots + \frac{1}{n^2}\sigma^2}_{n \text{ times}} \\ &= n \cdot \frac{1}{n^2}\sigma^2 \\ &= \boxed{\frac{\sigma^2}{n}} \end{aligned}$$

- Remember  $\text{Var}(\bar{X}) = \frac{\sigma^2}{n}$ : it's another important result.

## Example: length of seeds

- ▶ A botanist has collected a sample of 10 seeds and measures the length of each.
- ▶ The seed lengths  $X_1, X_2, \dots, X_{10}$  are supposed to be iid with mean  $\mu = 5$  mm and variance  $\sigma^2 = 2$  mm<sup>2</sup>.

$$E(\bar{X}) = \mu = 5$$

$$\text{Var}(\bar{X}) = \sigma^2/n = 2/10 = 0.2$$

of a Function

Expectations and  
variances of linear  
combinations

The Central Limit  
Theorem

- ▶ If  $X_1, X_2, \dots, X_n$  are *any* iid random variables with mean  $\mu$  and variance  $\sigma^2 < \infty$  then as  $n \rightarrow \infty$

$$\bar{X} \approx \text{Normal} \left( \mu, \frac{\sigma^2}{n} \right)$$

- ▶ The Central Limit Theorem (CLT) one of the most important and useful results in statistics.

## Example: tool serial numbers

- ▶  $W_1$  = last digit of the serial number observed next Monday at 9 AM
- ▶  $W_2$  = last digit of the serial number the Monday after at 9 AM
- ▶  $W_1$  and  $W_2$  are independent with pmf:

$$f(w) = \begin{cases} 0.1 & w = 0, 1, 2, \dots, 9 \\ 0 & \text{otherwise} \end{cases}$$

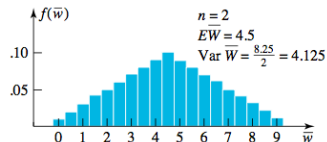

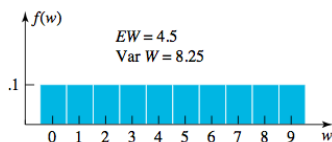

- ▶  $\bar{W} = \frac{1}{2}(W_1 + W_2)$  has the pmf:

The Probability Function for  $\bar{W}$  for  $n = 2$

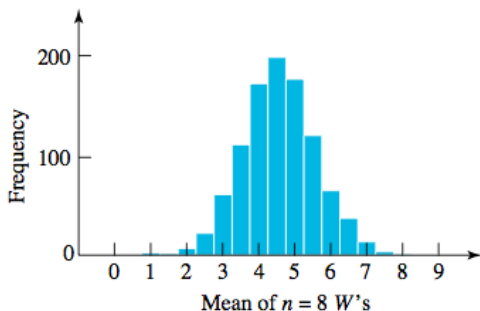

$\bar{w}$	$f(\bar{w})$	$\bar{w}$	$f(\bar{w})$	$\bar{w}$	$f(\bar{w})$	$\bar{w}$	$f(\bar{w})$	$\bar{w}$	$f(\bar{w})$
0.0	.01	2.0	.05	4.0	.09	6.0	.07	8.0	.03
0.5	.02	2.5	.06	4.5	.10	6.5	.06	8.5	.02
1.0	.03	3.0	.07	5.0	.09	7.0	.05	9.0	.01
1.5	.04	3.5	.08	5.5	.08	7.5	.04		

## Example: tool serial numbers

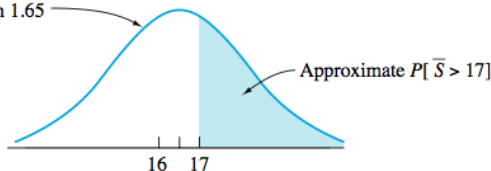

- What if  $\bar{W} = \frac{1}{8}(W_1 + W_2 + \cdots + W_8)$ , the average of 8 days of initial serial numbers?

## Example: excess sale time

- ▶  $\bar{S}$  = sample mean excess sale time (over a 7.5 s threshold) for 100 stamp sales.
- ▶ Each individual excess sale time should have an  $\text{Exp}(\alpha = 16.5 \text{ s})$  distribution. That means:
  - ▶  $E(\bar{S}) = \alpha = 16.5 \text{ s}$
  - ▶  $SD(\bar{S}) = \sqrt{\text{Var}(\bar{S})} = \sqrt{\frac{\alpha^2}{100}} = 1.65 \text{ s}$
  - ▶ By the Central Limit Theorem,  $\bar{S} \approx N(16.5, 1.65^2)$
- ▶ We want to approximate  $P(\bar{S} > 17)$ .

The approximate probability distribution of  $\bar{S}$  is normal with mean 16.5 and standard deviation 1.65

## Example: excess sale time

$$\begin{aligned}P(\bar{S} > 17) &= P\left(\frac{\bar{S} - 16.5}{1.65} > \frac{17 - 16.5}{1.65}\right) \\&\approx P(Z > 0.303) \quad (Z \sim N(0, 1)) \\&= 1 - P(Z \leq 0.303) \\&= 1 - \Phi(0.303) \\&= 1 - 0.62 \quad \text{from the standard normal table} \\&= 0.38\end{aligned}$$

## Example: net weight of baby food jars

Functions of  
Several Random  
Variables (Ch. 5.5)

Dason Kurkiewicz

Functions of  
Several Random  
Variables

Approximating the  
Mean and Variance  
of a Function

Expectations and  
variances of linear  
combinations

The Central Limit  
Theorem

- ▶ Individual jar weights are iid with unknown mean  $\mu$  and standard deviation  $\sigma = 1.6$  g
- ▶  $\bar{V}$  = sample mean weight of  $n$  jars  $\approx N\left(\mu, \frac{1.6^2}{n}\right)$ .
- ▶ We want to find  $\mu$ . One way to hone in on  $\mu$  is to find  $n$  such that:

$$P(\mu - 0.3 < \bar{V} < \mu + 0.3) = 0.8$$

That way, our measured value of  $\bar{V}$  is likely to be close to  $\mu$ .

## Example: net weight of baby food jars

Functions of  
Several Random  
Variables (Ch. 5.5)

Dason Kurkiewicz

Functions of  
Several Random  
Variables

Approximating the  
Mean and Variance  
of a Function

Expectations and  
variances of linear  
combinations

The Central Limit  
Theorem

$$0.8 = P(\mu - 0.3 < \bar{V} < \mu + 0.3)$$

$$= P\left(\frac{-0.3}{1.6/\sqrt{n}} < \frac{\bar{V} - \mu}{1.6/\sqrt{n}} < \frac{0.3}{1.6/\sqrt{n}}\right)$$

$$\approx P(-0.19\sqrt{n} < Z < 0.19\sqrt{n}) \quad (\text{by CLT})$$

$$= 1 - 2\Phi(-0.19\sqrt{n}) \quad (\text{look at the } N(0,1) \text{ pdf})$$

$$\Phi^{-1}(0.1) = -0.19\sqrt{n}$$

$$n = \frac{\Phi^{-1}(0.1)^2}{(-0.19)^2}$$

$$= \frac{(-1.28)^2}{(-0.19)^2} \quad (\text{standard normal table})$$

$$= 46.10$$

► Hence, we'll need a sample size of  $n = 47$ .

## Example: cars

- ▶ Suppose a bunch of cars pass through certain stretch of road. Whenever a car comes, you look at your watch and record the time.
- ▶ Let  $X_i$  be the time (in hours) between when the  $i$ 'th car comes and the  $(i+1)$ 'th car comes,  $i = 1, \dots, 44$ . Suppose you know:

$$X_1, X_2, \dots, X_{44} \sim \text{iid } f(x) = e^{-x} \quad x \geq 0$$

- ▶ Find the probability that the average time gap between cars exceeds 1.05 hours.

## Example: cars

$$\mu = E(X_1)$$

$$= \int_{-\infty}^{\infty} xf(x)dx$$

$$= \int_0^{\infty} xe^{-x}dx$$

$$= -e^{-x}(x+1)|_0^{\infty} \quad \text{integration by parts}$$

$$= 1$$

## Example: cars

$$\begin{aligned}E(X_1^2) &= \int_{-\infty}^{\infty} x^2 f(x) dx \\&= \int_0^{\infty} x^2 e^{-x} dx \\&= -e^{-x}(x^2 + 2x + 2)|_0^{\infty} \quad \text{integration by parts} \\&= 2 \\\sigma^2 &= \text{Var}(X_1) \\&= E(X_1^2) - E^2(X_1) \\&= 2 - 1^2 \\&= 1\end{aligned}$$

## Example: cars

$$\begin{aligned}\bar{X} &\sim \text{approx. } N(\mu, \sigma^2/n) \\ &= N(1, 1/44)\end{aligned}$$

Thus:

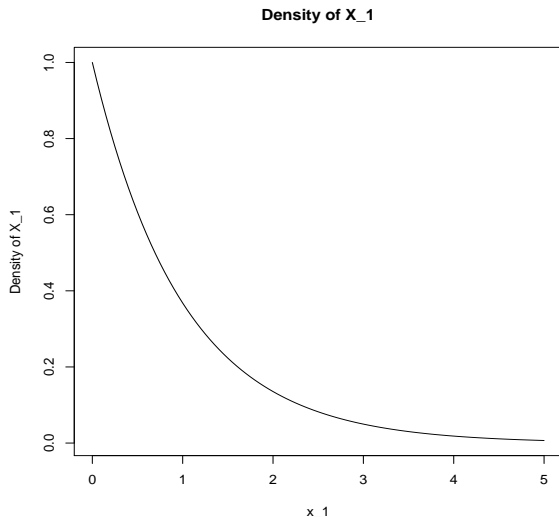

$$\frac{\bar{X} - 1}{\sqrt{1/44}} \sim N(0, 1)$$

## Example: cars

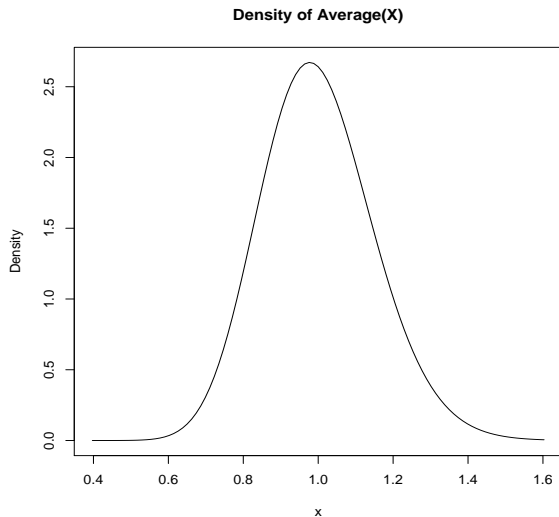

Now, we're ready to approximate:

$$\begin{aligned}P(\bar{X} > 1.05) &= P\left(\frac{\bar{X} - 1}{\sqrt{1/44}} > \frac{1.05 - 1}{\sqrt{1/44}}\right) \\&= P\left(\frac{\bar{X} - 1}{\sqrt{1/44}} > 0.332\right) \\&\approx P(Z > 0.332) \\&= 1 - P(Z \leq 0.332) \\&= 1 - \Phi(0.332) \\&= 1 - 0.630 = 0.370\end{aligned}$$

# Example: cars

# Example: cars

# Example: cars
